1 Question 1

Suppose that $Y = X^3$ and $f_X(x) = 42x^5(1 - x), x \in (0, 1)$. We are asked to find the PDF of Y .

We will begin by finding the CDF of Y :

$$\begin{aligned} P(Y \leq y) &= P(X^3 \leq y) = P(X \leq y^{1/3}) = \int_0^{y^{1/3}} f_X(x) dx = \int_0^{y^{1/3}} 42x^5 - 42x^6 dx \\ &= (7x^6 - 6x^7)|_0^{y^{1/3}} = (7y^2 - 6y^{7/3}) - 0 = 7y^2 - 6y^{7/3}. \end{aligned}$$

Thus, $F_Y(y) = 7y^2 - 6y^{7/3}$. $f_Y(y) = \frac{d}{dy} F_Y(y) = \frac{d}{dy} 7y^2 - 6y^{7/3} = 14y - \frac{42}{3}y^{4/3}$.

We will check that this integrates to 1: $\int_{-\infty}^{\infty} f_Y(y) dy = \int_0^1 f_Y(y) dy = F_Y(y)|_0^1 = (7 - 6) - (0) = 1$.

2 Question 2

Let $x \in [0, 1]$ and define F_X, f_X, a as described in the problem. We then have 3 cases:

- $x < 0.5$: In this case, $\int_0^x f_X(t) dt = \int_0^x 1.2 dt = 1.2x$.
- $x = 0.5$: In this case, $\int_0^x f_X(t) dt = \int_0^{0.5} 1.2 dt + \int_0^{0.5} .5a dt = 0.6 + 0 = 0.2 + 0.8(x)$.
- $x > 0.5$: In this case, $\int_0^x f_X(t) dt = \int_0^{0.5} 1.2 dt + \int_0^{0.5} .5a dt + \int_{0.5}^x 0.8 dt = 0.6 + 0 + 0.8x - 0.4 = 0.2 + 0.8(x)$.

Thus, $F_X(x) = \int_0^x f_X(t) dt \forall x \in [0, 1]$.

*I worked on this assignment with my study group: Alex von Hafften, Andrew Smith, and Ryan Mather. I have also discussed problem(s) with Emily Case, Sarah Bass, and Danny Edgel.

3 Question 3

We will begin by finding the CDF of Y. $P(Y \leq y) = P(X^2 \leq y) = P(|X| \leq \sqrt{y}) = P(-\sqrt{y} \leq X \leq \sqrt{y})$. Note: Y is weakly positive.

For $y \in [0, 1]$,

$$\begin{aligned} P(-\sqrt{y} \leq X \leq \sqrt{y}) &= \int_{-\sqrt{y}}^{\sqrt{y}} (2/9)(x+1)dx = ((1/9)x^2 + (2/9)x)|_{-\sqrt{y}}^{\sqrt{y}} \\ &= ((1/9)y + (2/9)\sqrt{y}) - ((1/9)y - (2/9)\sqrt{y}) = (4/9)\sqrt{y} \\ \Rightarrow f_Y(y) &= \frac{d}{dy}(4/9)\sqrt{y} = (2/9)y^{-1/2}. \end{aligned}$$

For $y \in (1, 4]$,

$$\begin{aligned} P(-\sqrt{y} \leq X \leq \sqrt{y}) &= \int_{-1}^{\sqrt{y}} (2/9)(x+1)dx = ((1/9)x^2 + (2/9)x)|_{-1}^{\sqrt{y}} \\ &= ((1/9)y + (2/9)\sqrt{y}) - ((-1/9) - (2/9)) = (1/9)y + (2/9)\sqrt{y} + (1/3) \\ \Rightarrow f_Y(y) &= \frac{d}{dy}((1/9)y + (2/9)\sqrt{y} + (1/3)) = (1/9) + (1/9)y^{-1/2} \end{aligned}$$

4 Question 4

We will find the median of the given distribution.

$$\begin{aligned} P(X \leq m) &= \int_{-\infty}^m \frac{1}{\pi(1+x^2)}dx = \tan^{-1}x|_{-\infty}^m = \tan^{-1}(m) - \tan^{-1}(\infty) = \tan^{-1}(m) + \frac{\pi}{2} \\ \Rightarrow P(X \leq m) &= 0.5 \rightarrow \tan^{-1}(m) + \frac{\pi}{2} = 0.5 \Rightarrow m = \tan(0.5 - \frac{\pi}{2}) \\ \Rightarrow m &= -1.83. \end{aligned}$$

5 Question 5

We will begin by finding $E|X - a|$, $a \in \mathbb{R}$. We have that $E|X - a| = \int_{-\infty}^{\infty} |t - a|f_X(t)dt = \int_{-\infty}^a (a - t)f_X(t)dt + \int_a^{\infty} (t - a)f_X(t)dt = \int_{-\infty}^a af_X(t)dt - \int_{-\infty}^a tf_X(t)dt + \int_a^{\infty} tf_X(t)dt - \int_a^{\infty} af_X(t)dt$

6 Question 6

6.1 Show that if a density function is symmetric about a point a, then $\alpha_3 = 0$.

Let X be a random variable, with a density function symmetric about point a. Define $Y = X - a$, a random variable. Notice that $E[Y^3] = E[(-Y)^3]$ by the symmetry of the distribution of X. This implies that $E[Y^3] = 0$. Also, by symmetry, $E[X] = a$ so $\mu_3 = E(X - E[X])^3 = 0$. Thus $\alpha_3 = 0$.

6.2 Calculate α_3 for $f(x) = e^{-x}, x \geq 0$

By the chain rule, $E[X] = \int_0^\infty te^{-t}dt = -te^{-t} - e^{-t}|_0^\infty = 1$.

$E(X^2) = \int_0^\infty t^2e^{-x}dt = (-t^2e^t)|_0^\infty + 2 \int_0^\infty te^{-t}dt = 2$. Thus, $\mu_2 = E(X^2) - E(X)^2 = 2 - 1 = 1$.

$E(X - E(X))^3 = \int_0^\infty (t - 1)^3e^{-x}dt = \int_0^\infty (t^3 - 3t^2 + 3t - 1)e^{-x}dt$
 $= \int_0^\infty t^3e^{-x}dt - 3 \int_0^\infty t^2e^{-x}dt + 3 \int_0^\infty te^{-x}dt - \int_0^\infty e^{-x}dt = \int_0^\infty t^3e^{-x}dt - 3(2) + 3(1) - (1)$
 $= (-t^3e^{-t})|_0^\infty + 3 \int_0^\infty t^2e^{-t}dt - 4 = 0 + 3(2) - 4 = 2 = \mu_3$.

Thus, $\alpha_3 = \frac{2}{1^{3/2}} = 2$.

6.3 Calculate α_4 for the listed densities and comment on the peakedness of the distributions.
